Methods

Multipole decomposition method

Regular electric dipole
moment of the scatterer

$$\mathbf{p} = \int \mathbf{P}(\mathbf{r}') d\mathbf{r}'$$

Toroidal dipole moment, having
the same radiation pattern

$$\mathbf{T} = \frac{i\omega}{10} \int \{2\mathbf{r}'^2 \mathbf{P}(\mathbf{r}') - (\mathbf{r}' \cdot \mathbf{P}(\mathbf{r}')) \mathbf{r}'\} d\mathbf{r}'$$

Miroshnichenko A. E. et al., Nature communications 6 (2015): 8069

Scattering cross-section
(considering multipole
moments up to the electric
octupole moment)

$$\begin{aligned} \sigma_{\text{sca}} \simeq & \frac{k_0^4}{6\pi\epsilon_0^2 |\mathbf{E}_{\text{inc}}|^2} |\mathbf{p} + \frac{ik_0\epsilon_d}{c} \mathbf{T}|^2 + \frac{k_0^4\epsilon_d\mu_0}{6\pi\epsilon_0 |\mathbf{E}_{\text{inc}}|^2} |\mathbf{m}|^2 \\ & + \frac{k_0^6\epsilon_d}{720\pi\epsilon_0^2 |\mathbf{E}_{\text{inc}}|^2} \sum |Q_{\alpha\beta}|^2 + \frac{k_0^6\epsilon_d^2\mu_0}{80\pi\epsilon_0 |\mathbf{E}_{\text{inc}}|^2} \sum |M_{\alpha\beta}|^2 \\ & + \frac{k_0^8\epsilon_d^2}{1890\pi\epsilon_0^2 |\mathbf{E}_{\text{inc}}|^2} \sum |O_{\alpha\beta\gamma}|^2. \end{aligned}$$

Evlyukhin A. B. et al., Physical Review B. 94.20 (2016): 205434

Toroidal dipole moment

In the terms of irreducible representation of Cartesian multipoles toroidal dipole moment is a term which is separated from symmetrized and traceless magnetic quadrupole and electric octupole moments. It has the same far-field radiation pattern as electric dipole moment and can interfere with it constructively and destructively.

Resonant forward scattering of light by high refractive-index dielectric nanoparticles with toroidal dipole contribution

Terekhov P.D. et al., 'Resonant forward scattering of light by high-refractive-index dielectric nanoparticles with toroidal dipole contribution', *Optics Letters* 42:4. 835-838 (2017).

Considered System

$$H = 90 - 300 \text{ nm}, D_c = 100 \text{ nm}.$$

$$\lambda = 400 - 800 \text{ nm}.$$

Scattering cross-section of nanocylinders with different H

TED, MD and MQ Evolution with height increasing

The separated development of multipoles contributions to the scattering cross section for dielectric nanocylinder with respect to height increasing.

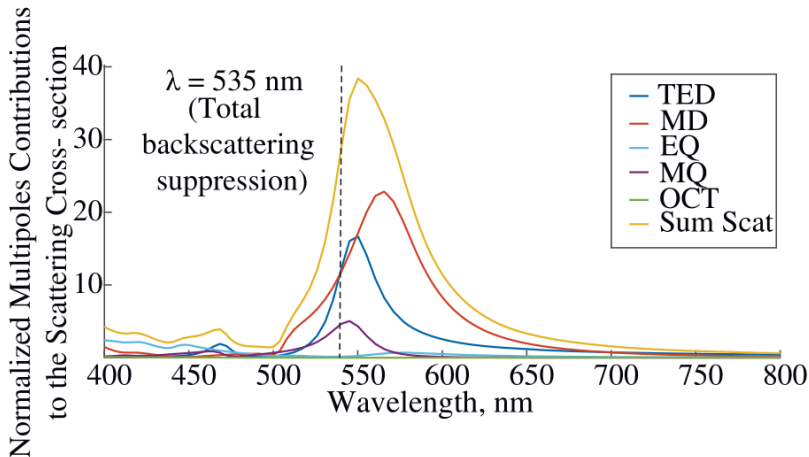

$H = 90, 210$ and 300 nm,
 $D_c = 100$ nm.

Spectra of the absolute values of TED, ED, and TD

$H = 90$ and 300 nm, $D_c = 100$ nm.

Multipole contributions to the scattering cross-section

- Resonant forward scattering of light by high refractive-index dielectric nanoparticles with toroidal dipole contribution

- Main results

Forward/Backward Scattering and TED & MD Phases

$$H = 300 \text{ nm}$$

$$D_c = 100 \text{ nm}$$

Radiation Patterns

Radiation pattern at the maximum scattering wavelength

Radiation pattern at the maximum forward/backward scattering wavelength (**Kerker effect**)

Cylindrical nanoparticle, $H = 300$ nm, $D_c = 100$ nm.

Summary on resonant forward scattering

- Constructive interference between toroidal and electric dipole moments of the nanoparticle can be realized in silicon nanoparticles
- Total electric dipole moment with dominant contribution of the toroidal dipole is resonantly excited in the nanoparticles and so called super-dipole mode is numerically demonstrated
- Due to the interference between electromagnetic fields generated by the total electric dipole and magnetic dipole moments of the nanoparticles, the Kerker-type effect (backward scattering suppression) can be numerically shown

Optical multipole resonances of non-spherical silicon nanoparticles and the influence of illumination direction

**Terekhov P.D. et al., 'Multipolar response of non-spherical silicon nanoparticles in the visible and near-infrared spectral ranges',
Physical Review B 96, 035443 (2017)**

Nanoparticles of different shape

Parallelepiped, pyramid, and cone with varying height H and diameter of $D = 250$ nm.

Optical multipole resonances of non-spherical silicon nanoparticles and the influence of illumination direction

Cubes and Parallelepipeds

Multipole contributions to the scattering cross-section

- Optical multipole resonances of non-spherical silicon nanoparticles and the influence of illumination direction

- Cubes and Parallelepipeds

Scattering cross-section of nanoparallelepipeds

For parallelepipedal nanoparticles with changed height separated MQ resonance disappears and becomes merged with TED resonance. If we increase the height of the particle, the resonant region becomes non-resonant and provides side-scattering type of radiation pattern.

Multipole Decomposition of SCS of nanopyramid

Influence of the particle height

Evolution of multipole resonances with changing the height of nanopyramid.

Multipole decomposition of SCS of Si nanocone

Unsymmetry effect in nanopyramid scattering

2D scattering patterns: the incidence (a,b) from the pyramid base, $\lambda = 516$ nm and 759 nm, ((c,d) from the pyramid top, $\lambda = 516$ nm and 759 nm. Red (green) contour corresponds to the plane of the incident E (H) polarization.

Summary on multipole excitations in Si nanoparticles

- Multipoles up to the third order that were excited by light in parallelepipedal, pyramidal, and conical silicon nanoparticles were investigated.
- Peculiar scattering patterns (even side-scattering) with certain predominant scattering directions can be obtained by tuning the spectral overlap of several multipoles.
- It has been shown that the effect of the asymmetrical multipole response in conical and pyramidal particles depends on the illumination direction.
- Our investigation provides important information about the roles of the high order multipoles in the light scattering by nonspherical nanoparticles and can be applied for the development of the nanoantennas, metasurfaces, coatings etc.

Influence of surrounding media refractive index

Terekhov P.D. et al., 'Wideband forward-scattering effect and multipoles evolution in media' (*In preparation*)

└ Influence of surrounding media refractive index

└ Multipole decompositions in different media

Multipole decomposition of SCS for $n = 1$ and $n = 1.2$

Evolution of Scattering cross-section as n changes.

3D radiation patterns in the area of MQ resonance

Radiation patterns for (a) $n_{env} = 1$, $\lambda = 765nm$ (b) $n_{env} = 1.2$, $\lambda = 775nm$
 (c) $n_{env} = 1.4$, $\lambda = 783nm$ (d) $n_{env} = 1.6$, $\lambda = 789nm$ (e) $n_{env} = 1.8$,
 $\lambda = 789nm$ (f) $n_{env} = 2$, $\lambda = 789nm$.

3D current distributions in the area of MQ resonance

Electric field distribution inside the nanocube for (a) $n_{env} = 1$, $\lambda = 765nm$ (b) $n_{env} = 1.2$, $\lambda = 775nm$ (c) $n_{env} = 1.4$, $\lambda = 783nm$ (d) $n_{env} = 1.6$, $\lambda = 789nm$ (e) $n_{env} = 1.8$, $\lambda = 789nm$ (f) $n_{env} = 2$, $\lambda = 789nm$.

2D radiation patterns in $n = 2$ media for several λ

2D radiation patterns in $n = 2$ media for λ mentioned in the legend.

Conclusions

- Directly calculated scattering cross-sections are close to the sum of multipole contributions, but there is some difference for high-index surroundings.
- Electric multipole moments (TED, EQ) experience stronger red-shift than magnetic multipole moments (MD, MQ).
- Separated scattering cross-section peaks transform to smoother merged peaks as n rises; separated MQ and EQ resonances are not longer exist for high-index media.
- Overall scattering cross-section of Si Cube increases as n rises.
- Multipole decomposition method can be applied for non-air media.
- For high-index media amplification of broadband forward scattering amplification takes place.
- Current distributions inside the nanocube concentrates in the forward part of the particle as n rises.

Multipole analysis of periodic metasurfaces and engineering of broadband absorption

Terekhov P.D. et al., 'All-dielectric metasurfaces engineered absorption' (*In preparation*)

Possible Applications

Decker M. et al. 'High-Efficiency Dielectric Huygens Surfaces' Advanced Optical Materials 3.6 (2015): 813-820

Arbabi A. et al. 'Dielectric metasurfaces for complete control of phase and polarization with subwavelength spatial resolution and high transmission.' Nature nanotechnology 10 (2015): 937-942

Considered System

In this work we study silicon metasurface based on cubic meta-atoms when
 1) metasurface surrounded by air and 2) metasurface is located on the glass substrate

- ↳ Multipole analysis of periodic metasurfaces and engineering of broadband absorption

- ↳ Research of single cube properties

Multipole contributions to the scattering cross-section

└ Periodic silicon structure in the air

Single cube vs array of cubes

Connection to the transmission spectra

└ Multipole analysis of periodic metasurfaces and engineering of broadband absorption

└ Silicon metasurface on the substrate

Metasurface imaging

SEM image of fabricated metasurface.

└ Multipole analysis of periodic metasurfaces and engineering of broadband absorption

└ Silicon metasurface on the substrate

Proof of concept of experiment

Schematics of the experimental setup (left) and photograph of the constructed setup (right).

Experiment - Modelling comparison of transmission

Transmission spectra: experimental (black) and calculated (red).

Multipole analysis of the metasurface on substrate

According to multipole decomposition, the presented reflection peak corresponds to the area of predominating EQ resonance, and the dip in transmission can be associated with the absorption peak; this peak can be associated with MD resonance excitation. Multipole decomposition has been performed using the similar method as for single nanoparticle in the air.

Summary on dielectric metasurfaces research

- Silicon metasurface created based on single particle investigations have been studied.
- Multipoles contribution to electric field amplitudes was compared for 1) single cube and 2) array of cubes.
- Si metasurface on bk7 substrate have been investigated numerically and experimentally.
- Multipole decomposition of currents in the meta-atoms of metasurface on substrate have been performed.
- EQ and MD resonance areas are associated with the reflection and absorption peaks correspondingly.

Our works

The research described in this talk is summarised in my recent publications:

- 1 **Terekhov P. D.** et al. 'Resonant forward scattering of light by high-refractive-index dielectric nanoparticles with toroidal dipole contribution', *Optics Letters* 42:4. 835-838 (2017).
- 2 **Terekhov P. D.** et al. 'Multipolar response of non-spherical silicon nanoparticles in the visible and near-infrared spectral ranges', *Physical Review B* 96, 035443 (2017).
- 3 **Terekhov P. D.** et al. 'All-dielectric metasurfaces engineered absorption' (*In preparation*)
- 4 **Terekhov P. D.** et al. 'Wideband forward-scattering effect and multipoles evolution in media' (*In preparation*)

To be continued

Currently I am doing my research in Ben-Gurion University and ITMO University under the joint supervision of Dr. Alina Karabchevsky (BGU) and Dr. Alexander Shalin (ITMO). We are exploring interesting directions of the research described, such as:

- **Influence of non-air medium** on multipoles excitation.
- **Enhanced light-matter interaction** as with plasmonic nanoantennas reported by *A. Karabchevsky et al, Nature Light Sci&Appl. 5, e16164 (2016)*, but using all-dielectric nanoantennas as alternative.
- **Coupling of two resonant systems**: All-dielectric resonator to molecular resonator which may be described by high order multipole moments (*A. Karabchevsky and A. Kavokin, Nature Sci Rep 6:1-7 (2016)*).
- **Optical properties of all-dielectric metasurfaces** which support high-order multipole excitation.
